1. INTRODUCTION

The sustainable management of tropical forests for the past decade had been a major preoccupation for the international community. Cameroon has been deeply involved in this process since it put in place rules and regulations since the 90's for good forest Governance, this shows the importance accorded to the forestry sector and the sustainable management of its forests.

The most important of these laws is Law n°94/01 of 20th January with clauses on Forestry, Wildlife and Fishing that subdivides the forestry domain into permanent and non permanent domains. The permanent forest domain is made up of domanial and council forests.

A council forest is a forest that has been attributed to a council concerned or has been planted by the council. Like all forests of the permanent domain, council forests need to have management plans that are verified and approved by the administration in charge of forests.

The management plan is a document with the principal objective of planning logging activities in a permanent way, through the programming in time and in space of felling and silvicultural activities aiming at a sustained production.

The public notice of Nguti council forest with a surface area of 12,083ha has been signed by the Minister of Forestry and Wildlife in November 2007. Meanwhile the gazettement process is going on; a forest management plan is elaborated for Nguti Council Forest.

The first step to elaborate a forest management is the estimation of the existing forest potential through a forest management inventory. Hence, the Nguti council in collaboration with PSMNR-SWP commissioned MIPELDA to carry out the forest management inventory for this forest.

This document presents the results of this inventory that conforms to the required norms. It also describes the methodology used, the biophysical milieu, the socioeconomic environment in summary, as well as the human resource and material used.

2. BIOPHYSICAL ENVIRONMENT

2.1. Location

The proposed council forest of Nguti is situated in Nguti Sub-division, Kupe-Manenguba Division, South-West Province of Cameroon. (cf. map1). It is situated between latitude 5°12'10" N and 5°19'20"N and between longitude 9°10'48"E and 9°21'23"E.

On its western part, the Nguti Council forest has a common boundary with the Korup National park, along the Bake river. In its northern part it has a common boundary with proposed Nkwende hill protection forest. Just across the Bake River to the east is a community forest. The FMU 11-001 of TRC is also very close to this council area. There are also conservation sites of particular interest quite close to the council area, notably the Bakossi Mountains, the Bayang Mbo Wildlife Sanctuary, and the Nta ali Forest reserve.

The surface area of the proposed Nguti Council forest is about 12,083 ha.

The boundaries are described as follow.

East: From point A located at the river junction from Ayib-Eyang following Baker river following Bake river downstream to point B (533873, 577433) still along the river, which is the south western limit of the REPACIG CIG community forest and still in the south westerly direction to point C (534027, 575188), which is the confluence between river Bake and river Bakebe around Ayong village

South: Then from point C and moving in a north westerly direction to point D (529440 , 577485) along river Bake to point E (530334 , 576605), which is the confluence between the rivers Bake and Madle, marking the north eastern boundary of the Korup national park.

West:

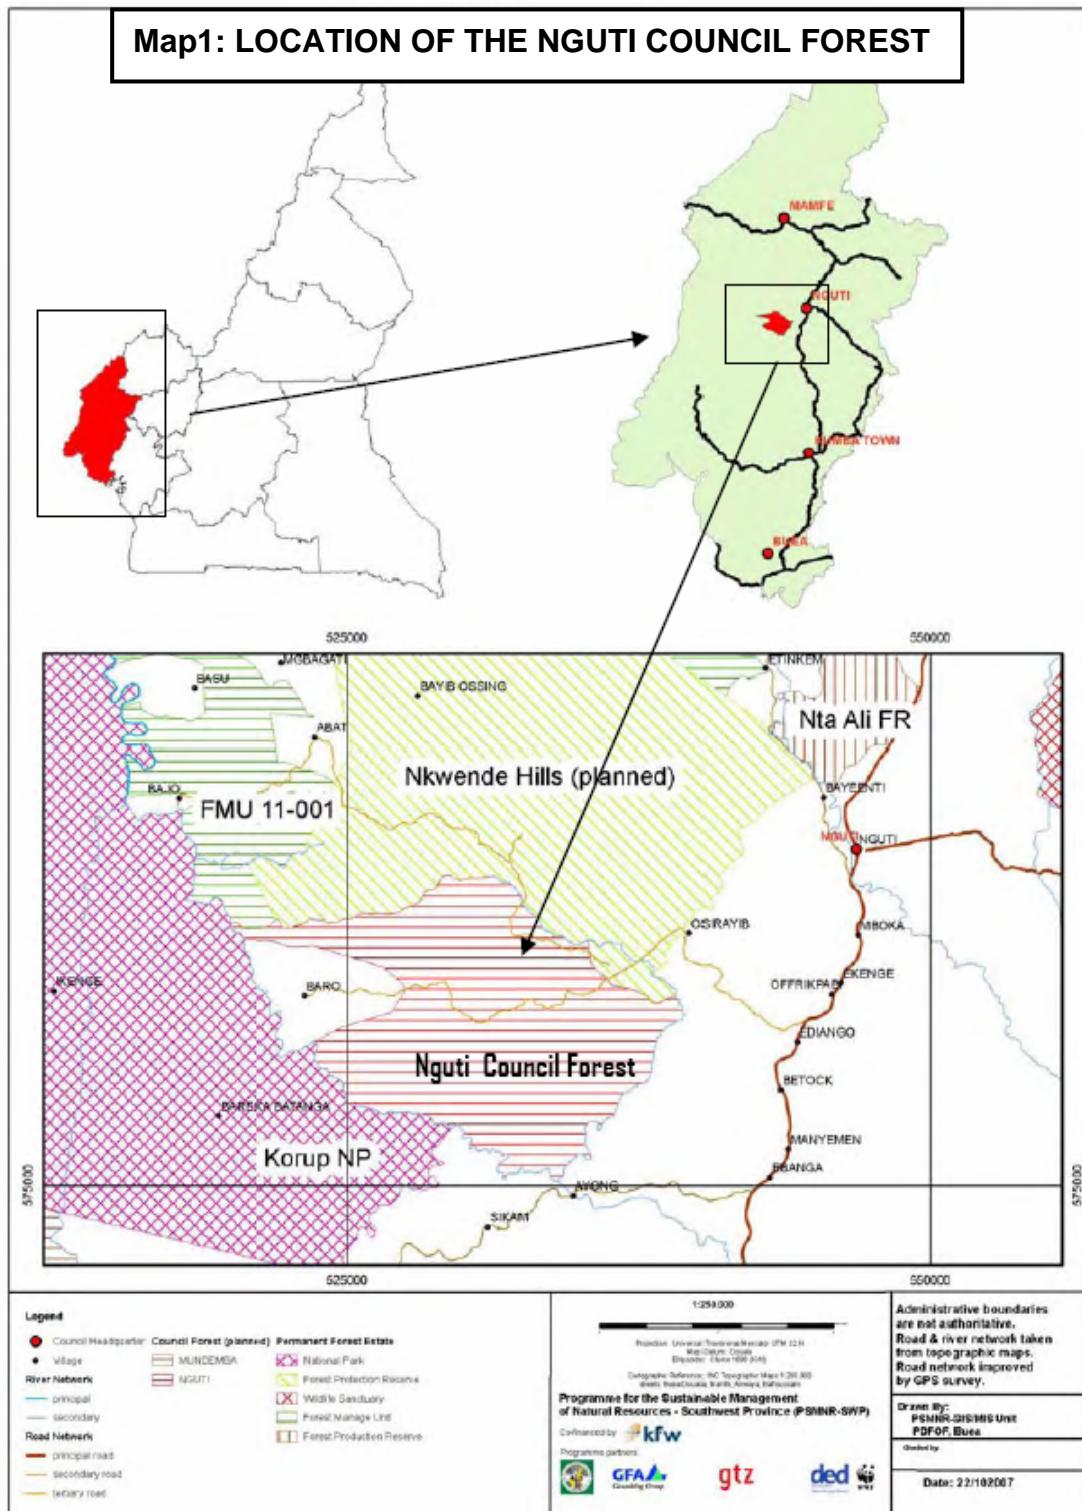

- From point E following the boundary of the Korup National Park along the river Bake to point F(523570 , 581120);
- From point F following a straight line on bearing of 64° for a distance of 1.4Km to point G(524816 ; 581727), located at the river junction of the stream Monyeneton with an abandoned farm to market road from Boro to Sikam;

- From point G following a straight line on a bearing of 73° for a distance of 2.2Km to point H(526905 , 582349), located at a river junction of not named rivers;
- From point H following a straight line on a bearing of 31° for a distance of 1.1km to point I(527508 , 583312), located on the abandoned logging road from Baro to Osirayib and named “Otto Green”;
- From point I following a straight line on a bearing of 331° for a distance of 0.3km to point J(527394 , 583593), located at a river junction of not named rivers;
- From point J following a straight line on a bearing of 310° for a distance of 1.1km to point K(526545 , 584278), located at a river junction of not named rivers;
- From point K in a straight line on a bearing of 286° for a distance of 3.2km to point L(523447 , 585198), located at the source of the stream Bayas near the footpath from Baro to Abat;
- From point L following the stream Bayas downstream to reach point M(520568 , 585462), located at the junction of Bayas with Bake river;
- From point M following Bake river downstream in northerly direction to point N(519990 , 586145), located at the junction of Bake with a not named affluent;

North:

- From the point N following the not named affluent upstream in easterly direction to point O(527781 , 586145), located at one of the sources of this stream;
- From point O following a straight line on a bearing of 86° for a distance of 0.6km to point P(531257 , 588130), located at the source of a not named stream;
- From point P following the not named steam downstream in easterly direction to point Q(535336 , 585433), located at the junction with another not named stream
- From point Q following a straight line on a bearing of 172° for a distance of 0.8km to point R(535445 , 584601), located at the source of the stream Ayib-Eyang;

- From point R following Ayib-Eyang downstream to reach the point of origin A, located at the junction of Ayib-Eyang with Bake River.

2.2. Relief

The Nguti council area is relatively flat as compared to the rest of the Division. Hilly topography is found in the west of the council forest area around the Nkwende hills. Apart from this rugged terrain, the rest of the council area is generally undulating and almost flat throughout. The proposed council forest is relatively flat. The highest point here is a hill with 428 m altitude.

2.3. Climate

The Nguti area has an equatorial climate of the northern coastal region with an average rainfall of about 4 000mm. It is characterised by two main seasons: the rainy and the dry seasons. The dry season is not intensive due to the region's proximity to the sea. It can be said that the region has a predominantly maritime climate, with rainfall throughout the year. Maximum rainfall occurs from June to October, while minimum rainfall is between December and January. This region is generally characterized by a semi-permanent cloud cover and with relatively high temperatures. As a consequence, there is intermittent rainfall during the dry season.

The annual maximum average temperature is 30.2° C and the minimum average temperature is 23.7°C. Mean annual humidity is 83%, the mean daily maximum being 98% and the minimum 66%. The tables below give the climatic data of the area.

Table1: Mean monthly and annual rainfall at the Mamfe Station for 32 years

Source: Hawkins and Brunt 1965

Table 2: Mean temperature data at Ndian Estate Weather Station from 1968 to 1981

Month	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.
	27,2	28,4	28,1	28,0	27,7	26,8	25,9	25,4	25,9	26,5	27,1	27,0

2.4. Vegetation

The forest is part of the Atlantic Biafran Forest as described by Letouzey and as such moist lowland evergreen forest. *Lejoly* (1996) proposes to nominate the zone Atlantic lower-Guinean domain to stress the influence of the Atlantic Ocean. Most of the

forest is dense forest on firm land. Only on the banks of the river Bake in some places small swampy areas can be found.

Frequently occurring species in the forest include; Azobe (*Lophira alata*), Ekop Naga (*Brachystegia spp*), Dabema (*Pipadeniastrum africanum*), Tali (*Erythrophleum ivorensis*), Okan (*Cyclodiscus gabonensis*), Framire (*Terminalia ivorensis*). Others occurring species are Bilinga (*Nauclea diderrichii*), Ilomba (*Pycnanthus angolensis*), Niove (*Staudia stipitata*), Padouk (*Pterocarpus soyauxii*), Moabi (*Baillonella toxisperma*), Movingui (*Distemonanthus benthamianus*), Doussie (*Afzelia spp*), Aiele (*Canarium schweinfurthii*).

2.5. Fauna

The proximity of the Nguti council forest with the protected areas (Korup national park and the Nta-Ali reserve contributes to the richness of its fauna. A wildlife survey will be conducted and be treated in a separate report. The following observations were made during the forest management inventory.

2.5.1. Mammals

The Nguti council forest is constituted of various types of mammal species, ranges from the African forest Elephant to the Brush-tailed porcupine, passing through various species of duiker, monkey, water chevrotain, red river hog and pangolin. Taking into account the number of individuals and prints found during the inventory the population mammals in the Nguti council forest can be estimated very diversified and abundant.

2.5.2. Avifauna

The avifauna is poorly known, but considering its evergreen forest type and the various chirp noticed during the field work, we can expect a great number of forest restricted biome species dominated by Greenbul, Hornbills, Turacos, forest francolins and doves.

Fishes, amphibians, reptiles were noticed mostly in the swampy areas, but no identification could be made.

2.5. Hydrography

The Nguti council area is well drained by small streams and rivers. Most of the rivers and streams take their rise from the Nkwende hills and flow in a south-western direction towards the Korup National Park and finally to Nigeria.

The hydrographic net of the Nguti council forest is composed of the Bake River and its tributaries. Bake River originates from Nkwende Hills and flows in a southerly direction and start marking the boundary of the Nguti council forest to the south of Osirayib village. Downstream, Bakebe River joins Bake River near Ayong village, and Bake River continues flowing in a north-westerly direction. The Nguti council forest is therefore enclosed by Bake River and some of its tributaries.

2.6. History of forest exploitation

Forest license N° 1669 of a surface area of 26 800 ha was granted to the company CTL. The license covered a big part of the proposed Nguti Council Forest. Timber exploitation took place from around 1987 to 1991. The exploitation is said to have been very selective and not quite systematic. Some earlier exploitation is said to have taken place in the 1970s by a company named ATC.

3. SOCIOECONOMIC ENVIRONMENT

3.1 Populations

The Nguti Council Area is made up of 56 villages with a total population of 63.500 inhabitants. There are 10 ethnic groups in this area, they are: Deboum, Bassossi, Upper-Balong, Ngamen Ngouaï, Abongue, Elumba, Ejagham (Osirayib), Mbanüe, Upper-Nkogo and Lowa-Nkogo. The whole council area presents basic social infrastructure insufficiency notably education and health.

There are four peripheral villages that have customary rights over the Nguti council forest area. These villages are very small settlements with low population densities, they are: Baro, Ayong, Osirayib and Sikam.

The size of the four villages that are directly linked to the Nguti council forest is small. There are no settlements within the proposed council forest area. What are located in the Nguti Counci Forest territory are temporary camps. The population of the four villages is as follows: Baro 243 inhabitants out of which are 32 non-natives, Osirayib 50 inhabitants with 08 non-natives, Sikam 350 inhabitants with 250 non-natives mostly from Meme and Ndian Divisions, and Ayong with 500 inhabitants the majority of which are settlers from the North West province of Cameroon. The table 1 describes the repartition of the populations in the four villages.

Table 1: Population statistics for the four villages

Village	Ethnic group	Total population
Baro	Upper Balong	243
Ayong	Upper Balong	500
Sikam	Upper Balong	350
Osirayib	Ejagham	50
Total	/	1.143

Source: Socioeconomic studies

3.2 Population activities

The main economic activities are: agriculture, animal rearing, food transformation (cassava, bush mango, Njabe oil, palm nuts, palm oil), handicraft, hunting, and forest activities. Apart from agriculture, animal rearing, and handicrafts, the rest of the activities do not involve any strong development effect.

The council area has a total of 5 markets and none has been constructed, no hanger nor warehouse, few sporting facilities, and many worship places of which the Presbyterian and apostolic churches are topping the list.

Two types of resources are used at the municipality level: forest resources and the non-forest resources. The former includes timber products such as construction timber for export and for local consumption logged by the timber companies, fuel wood, specific species of non-timber forest products (Bush mango, Njansang, Eru, Monkey kola, Bitter kola, Bush pepper, Njabe). Some of the NTFP are also used as medicine. The latter includes subsistence and cash crops cultivated at the local level. There is also a lot of hunting of wild animals and fishing of aquatic animals such as fish and crocodile.

The council area has a total of 5 markets and none has been constructed, no hanger nor warehouse, few sporting facilities

3.3 Infrastructures

3.3.1. Road network

The sub-division is served from the South to the North-Western end by the Kumba-Mamfe road (National N° 8). The road from Kumbe through Nguti towards Eyang along the Kumba-Mamfe road is tarred. Apart from this stretch of tarred road, the rest of the sub-division is served by feeder roads, a majority of which are in a very bad state.

3.3.2. Electricity, water and Communication

Electricity is generally lacking in this council area. Generators are owned by mission hospitals and some individuals in Nguti and Manyemen. Some small generators are found in some villages. As for water supply, pipe borne water is only found in Nguti, Manyemen and Ediango.

The Nguti council is covered by Orange mobile telephone network. This telephone service covers most of the villages with the exception of Baro. Radio waves are very irregular in some villages. Regular radio broadcast from neighbouring Nigeria is received very clearly.

3.3.3. Health

The Nguti council area has a total of 8 health facilities, among which are 2 big hospitals (RCM St John of God at Nguti and Presbyterian hospital Manyemen). There are 2 pharmacies within this council area. These pharmacies are owned by the above mentioned confessional hospitals. There are no pro-pharmacies. There are a total of 26 state owned health personnel in the council area. Prevailing diseases are malaria, STI, HIV/AIDS, skin diseases, and Typhoid. The structure for the control of HIV/AIDS in the area is known as Health Area Management committee for the Prevention and control of AIDS. This is the structure which has replaced Local AIDS Control Committees in the villages.

3.3.4. Education

The Nguti council area has a total of 39 primary and 4 nursery schools. These schools are owned by government, PTA and confessional bodies. Globally, there are 88 teachers in the Sub-division. Teacher pupil ratio is 1 teacher to 125 children. Globally, school infrastructure can be classified as bad.

As for secondary education, the council area has 7 secondary schools out of which 2 are SAR/SM. These secondary educational institutions are owned by the government. There is no higher institution of learning in this council area.

Table 2: School statistics for the four villages

Village	Type	Nº of classes	Nº of Students	Nº of teachers	State of the infrastructure		
					Good	Average	Bad
Baro	Govt	06	27	01			X
Ayong	Govt	06	149	02		X	
Sikam	Govt	06	165	03	X		
Osirayib	-	-	-	-	-	-	-

Source: adapted from the socioeconomic studies

**4. METHODOLOGY FOR THE REALISATION OF THE
INVENTORY**

4.1. Objectives

This inventory enters into the framework of the application of Law n° 94/01 of January 20th with the Forestry, Wildlife and Fishing clauses for a rational management of the Nguti council forest.

The objective of this inventory is to provide data concerning the potentialities of the Nguti council forest in terms of resources. The analysis of these data and the socioeconomic studies will provide adequate information for the elaboration of its management plan.

4.2. Sampling Design

The sampling is a systematic sampling at 1 degree with sampling plots positioned continuously on transects which are equidistant and parallel. The sampling lines were as far as possible perpendicular to the general orientation of the river network so that the variability of vegetation types is best represented in the sampling.

The plot as the basic unit of sampling is situated longitudinally on the enumeration transect; its surface is 0.5 ha with the dimensions of 250 m length (in the direction of the transect) x 20 m width (perpendicular to the transect direction).

4.3. Sampling intensity

The sampling intensity depends on the variability of a required parameter in the whole population and the decision which is taken concerning the precision of the estimation of this parameter. The required parameter in this case is the volume of the group of the principal exploited species. The Cameroonian norms argue that due to already realized inventories in the past a number of 500 plots shall be sufficient to obtain a precision of 10% for the volume of the main exploited species on the probability threshold of 95%.

Accordingly, the sampling intensity in this case was: $250 \text{ ha} / 12.083 \text{ ha} = 2,07\%$

The corresponding equidistance (E) of the transects is then:

- $E = \text{Area to be covered by the inventory (ha)} \times 20 \text{ m} / 250 \text{ ha}$
- $E = 12.083 \text{ ha} \times 20 \text{ m} / 250 \text{ ha} = 967 \text{ m}$
- Where E is the equidistance

However, for practical reasons an equidistance of 1000 m was chosen, which slightly reduce the sampling intensity. A total of 115.5Km of enumeration transects were temporary established to be opened in the field, corresponding to a total of 462 sampling plots. But due to inaccessibility and not complete plots¹, 426 sampling plots were effectively counted which give the sampling intensity of:

- SI=Area sampled x 100/ Total area
- SI=426x0.5ha×100/12,009.6683ha
- SI=1.7%
- Where SI is the sampling intensity

The table 3 provide the details of the sampling plan effectively materialised in the field.

Table3: Details of the sampling transects

Transect N°	Nb of Plots	Distance	Transect N°	Nb of Plots	Distance (m)
T1	1	250	T13	27	6750
T2	0	0	T14	16	4000
T3	16	4000	T15	18	4500
T4	10	2500	T16	17	4250
T5	21	5250	T17	14	3500
T6	25	6250	T18	25	6250
T7	25	6250	T19	06	1500
T8	27	6250	T20	42	10500
T9	27	6750	T21	04	1000
T10	28	7000	T22	15	3750
T11	29	7250	T23	08	2000
T12	25	6250	Total	426	106500

We can notice that a total of 117.5 km of transects were opened from which are:

- baseline transects: 11.0 km
- enumeration transects: 106.5 km

¹ In fact, at the end of each transect, plots may have a length of less than 250 m and as such a surface area less than 0,5 ha. These plots were enumerated but were not used for data processing because all the plots are considered by TIAMA to have a surface area of 0.5ha.

That means that 213 ha were sampled, which gives a sampling intensity of 1.7 %. This sampling intensity corresponds to all trees with a minimum diameter of 20 cm DB which are enumerated on the whole plot (250x20 m). On a sub-plot, on the first 50 m of each plot, also trees with a diameter under 20cm are enumerated. The surface area of this sub-plot is 50 x20 m = 0.1ha.

4.4. Field work

Two main phases were used to carry this inventory work, namely:

- The preparation of field work
- The data collection in the field

4.4.1. Preparation of field work

The preparatory mission consisted of recruitment of the inventory brigade and the acquisition of the equipment. The constitution of the inventory brigade can be described as follow:

- Contact with the administrative and local authorities;
- Recognition visit to the Nguti council forest;
- Sensitization of the local population on the activity to be carried out in their environment;
- Choosing of the base camp for the teams;
- Recruitment of local workers and
- Identification of starting point

The field work required a lot of document among which the most important are:

- The sampling plan;
- The different forms (Transect forms, enumeration forms);
- Norms of stratification and norms of inventory;
- Dendrometric manual, etc.

Technical material used included:

- Compasses
- Clinometers
- Cables steel

- Red paint
- Cutlasses
- Pens and pencils
- Files
- Rucksacks
- Rain boots, etc.

4.4.2. Data collection in the field

The field work took place from 19thJanuary to 20thFebruary 2008. It was carried out by an inventory brigade made up of:

- A Chief of Brigade
- Two chiefs of transect opening;
- Two chiefs of enumerating teams
- One chainman
- One recorders
- Six prospectors and the
- Local workers

The phase began with the training and recycling of all the personnel involved. Trainings concerned only the local indigenes and recycling was mainly for the qualified staff recruited from Yaoundé.

5. DATA ANALYSIS

5.1 Counted Species

All the trees with a DBH above or equal to 20cm were counted in the enumeration plots. The trees with a diameter under 20cm were counted in the floristic plots of each sampling plot. Five groups of species were defined for the data processing. They are:

- Group 1: Principal Species I;
- Group 2: Principal Species II
- Group 3: Secondary Species
- Group 4: Complementary Species
- Group 5: Others Species

5.2 Volume tables

The volume tables used for data analysis are those used by ONADEF during the national survey of forest resources for phase III. The volumes calculated are gross volumes over bark.

5.3 Cartography

Photo-interpretation of aerial photographs of the area completed with the interpretation of the satellite image was used to determine the different strata of the Nguti forest council.

Using this methodology, six forest strata were identified, namely:

- DHS/b(High Density Moist Evergreen Forest);
- DHS/d chp (Low Density Moist Evergreen Forest with windfall);
- DHS/d cp (Low Density Moist Evergreen Forest with partial felling)
- MIT (Temporarily Flooded Marshy Forest);
- A1 (Dry denuded)
- FR (Farming)

For the demarcation of the strata and calculation of surface area, the Software Arcview 3.2 was used. The surface area obtained is 12,009.668 ha whereas the public notice on the classification of the Nguti council forest was 12,083 ha that is a difference of 73 ha. In order to avoid contradiction in the data the surface area obtained during the stratification was used.

5.4 Software

The software used for data analysis of the Nguti forest council is the one known with its French acronym TIAMA (*Traitemen t des Inventaires Appliqué à la modélisation des Aménagements*)

CONCLUSION

Summarily the data analysis shows that the Nguti Council forest abounds an enormous potential in terms of exploitable timber resources with species of value.

These are respectively Azobé, Tali, Dabéma, Eyong, Emien, Andoung brun, Ilomba, Padouk rouge, Fraké Okan in terms of number of species inventoried. They represent 76.28% of the total of principal species inventoried.

In term of volume this order is Azobé, Tali, Dabéma, Emien, Eyong, Andoung brun, Okan, Ilomba, Fromager, Padouk rouge. They represent 78.36% of the total volume of principal species

We can then notice that the order in terms of number of trees is slightly different when we consider the volume.

The total number of exploitable principal species are 81 657 trees whereas the total exploitable volume is 702 711m³.

WEST

- From point E following the boundary of the Korup National Park along river Bake to point F (523570 , 581120);
- From point F following a straight line on bearing of 64° for a distance of 1.4 Km to point G (524816 , 581727), located at the junction of the stream Monyeneton with an abandoned farm to market road from Baro to Sikam;
- From point G following a straight line on a bearing of 73° for a distance of 2.2 Km to point H (526905 , 582349), located at a river junction of not named rivers;
- From point G following a straight line on a bearing of 31° for a distance of 1.1 km to point I (527508 , 583312), located on the abandoned logging road from Baro to Osirayib and named "Otto Green";
- From point I following a straight line on a bearing of 331° for a distance of 0.3 Km to point J (527394 , 583593), located at a river junction of not named rivers;
- From point J following a straight line on a bearing of 310° for a distance of 1.1 Km to point K (526545 , 584278), located at a river junction of not named rivers;
- From point K in a straight line on a bearing of 286° for a distance of 3.2 Km to point L (523447 , 585198), located at the source of the stream Bayas near the footpath from Baro to Abat;
- From point L following the stream Bayas downstream to reach point M (520568 , 585462), located at the junction of Bayas with Bake river;
- From point M following Bake river downstream in northerly direction to point N (519990 , 586145), located at the junction of Bake with a not named affluent;

NORTH

- From the point N following the not named affluent upstream in easterly direction to point O (527781 , 587716), located at one of the sources of this stream;
- From point O following a straight line on a bearing of 86° for a distance of 0.6 Km to point P (531257 , 588130), located at the source of a not named steam.
- From point P following the not named steam downstream in easterly direction to point Q (535336 , 585433), located at the junction with another not named steam.

- From point Q following a straight line on a bearing of 172° for a distance of 0.8 Km to point R (535445 , 584601), located at the source of the stream Ayib-Eyang;
- From point R following Ayib-Eyang downstream to reach again the point of origin A, located at the junction of Ayib-Eyang with Bake River.

This area is thus limited to a surface of 12 083 hectares.

The map indicating the area to be classified shall be placed to the public at the Ministry of Forestry and Wildlife, Department of Forestry in Yaounde, the South West Provincial Delegation, The Divisional Delegation of Forestry and Wildlife Bangem and the Nguti Council office.

Eventual objections and complaints of this classification project shall be received at the Bangem Senior Divisional Office within 90 days following the date of publication of this notice in the Divisional headquarters concern.

ATTESTATION OF CONFORMITY OF SAMPLING PLAN

The Minister of Forestry and Wildlife under signed, attests that the sampling plan for the Nguti Council Forest, with sampling intensity of 1.9% submitted for his appreciation by the Nguti Council through the South West Provincial Delegation of Forestry and Wildlife, elaborated by Simo Hubert for GFA/DFS CONSULTANTS, conforms with the forestry regulations in force.

By the way, following the dispositions of decree N° 0222/A/MINEF of 25th May 2001 fixing the procedures of elaboration, apprebaton, follow up and the implementation of the management plans for production forests of permanent forests, the Nguti Council is expected to be in touch with the Department of Forestry after the opening of the second transect for the verification of field work.

This attestation is issued to serve its intended purpose where and whenever necessary.

**ATTESTATION OF CONFORMITY OF FOREST
MANAGEMENT INVENTORY**

The Minister of Forestry and Wildlife, undersigned, attests after field verification that the forest management inventory for the Nguti Council Forest, realized by MIPELDA, an authorized inventorist and silviculturist, conforms to the norms of forest management inventory in force.

By the way, following the dispositions of decree N° 0222/A/MINEF of 25th May, 2001 fixing the procedures of elaboration, approbation, follow up and the implementation of the management plans of production forests of permanent forests, the Mayor of Nguti Council is expected to submit, within the shortest time possible, to the Minister of Forestry and Wildlife, the management plan of the said forest.

In testimony whereof, this attestation is issued to serve its previewed purpose./
